ASSIGNMENT

ENTREPRENEURSHIP SKILLS

Submitted By: Ayush Thakur

Roll No.: 25BAI10052

Class / Section: 25BAI601

Subject: Entrepreneurship Skills

Submitted To: Rajni Maam

College / University: Chandigarh University

Introduction

Entrepreneurship is the process of identifying opportunities, developing innovative ideas, organizing resources, taking calculated risks, and creating value through a new or existing business. An entrepreneur does not simply start a business; an entrepreneur identifies a problem or opportunity, develops a solution, brings resources together, and attempts to create sustainable value for customers and society.

Entrepreneurship is important for individuals as well as the economy. It creates opportunities for self-employment and employment of others, encourages innovation, promotes competition, supports local development, and contributes to economic activity. In the modern economy, entrepreneurship also plays an important role in technology-based businesses, social enterprises, digital services, and startups.

This assignment explains the complete process of starting a new business, the concept and components of a business plan, the role of entrepreneurship in employment and economic and social development, and the stages and success or failure factors of startups.

1. Explain the Complete Process of Starting a New Business from Generating a Business Idea to Launching a Product or Service

Starting a new business is a step-by-step process that transforms an initial idea into a product or service that customers are willing to purchase. The process requires creativity, market understanding, planning, financial management, legal preparation, product development, marketing, and continuous improvement. Although businesses differ by industry, the following stages provide a general framework.

1.1 Generating a Business Idea

The first stage is generating a business idea. A business idea may come from a personal experience, an existing problem, customer complaints, technological development, changes in lifestyle, market trends, hobbies, professional knowledge, or an opportunity observed in the local community.

Entrepreneurs should not focus only on what they can make. They should also ask what customers need and what problems they are willing to pay someone to solve. A good idea normally creates some form of value, such as saving time, reducing cost, increasing convenience, improving quality, or providing something that is currently unavailable.

For example, if college students have difficulty finding affordable and healthy food near campus, an entrepreneur could consider a low-cost healthy meal delivery service specifically designed for students.

1.2 Identifying and Defining the Problem

After generating an idea, the entrepreneur should clearly define the problem that the business intends to solve. A problem statement helps prevent the entrepreneur from developing a product without understanding its purpose.

- Who experiences the problem?
- How frequently does the problem occur?
- How serious or costly is the problem?
- How are customers currently solving it?
- Why are current solutions insufficient?
- Would customers pay for a better solution?

1.3 Identifying the Target Customers

The entrepreneur must identify the people or organizations most likely to purchase the product or service. This is called the target market. Customers can be segmented according to age, income, location, occupation, lifestyle, interests, business size, or purchasing behaviour.

A clear target market helps the entrepreneur design the product, pricing, marketing message, distribution channel, and customer service around a specific group instead of trying to serve everyone.

1.4 Market Research

Market research is the systematic collection and analysis of information about customers, competitors, industry conditions, and market trends. It reduces uncertainty and helps the entrepreneur make evidence-based decisions.

Primary research collects new information directly from potential customers. Examples include questionnaires, interviews, focus groups, observations, and product testing. Secondary research uses information already available in reports, government publications, industry studies, journals, websites, and databases.

- Estimate the size and characteristics of the target market.
- Understand customer needs and preferences.
- Identify competitors and their strengths and weaknesses.
- Study competitors' prices and distribution methods.
- Identify market trends and possible future changes.
- Determine whether customers are willing to pay.

1.5 Identifying Competitors and Competitive Advantage

The entrepreneur should identify both direct and indirect competitors. Direct competitors offer similar products or services, while indirect competitors solve the same customer problem in another way.

The entrepreneur then determines the competitive advantage of the new business. Competitive advantage may come from better quality, lower cost, convenience, customization, faster delivery,

stronger customer support, innovative technology, unique design, or another meaningful difference.

1.6 Developing the Business Model

A business model explains how the business will create value for customers and generate revenue. It answers questions such as who the customers are, what value is offered, how customers will be reached, what resources are required, and how the business will earn money.

The Business Model Canvas is a commonly used framework. Its major elements include customer segments, value proposition, channels, customer relationships, revenue streams, key resources, key activities, key partners, and cost structure.

1.7 Conducting a Feasibility Study

A feasibility study determines whether the proposed business is practical and worth pursuing. It examines different dimensions of the proposed venture.

- Market feasibility – Is there sufficient demand?
- Technical feasibility – Can the product or service be developed with available technology and skills?
- Financial feasibility – Can the business generate sufficient revenue and manage its costs?
- Operational feasibility – Can the business operate effectively?
- Legal feasibility – Can the business comply with applicable laws and regulations?

The feasibility study may also identify major risks and assumptions that need to be tested before significant money is invested.

1.8 Preparing a Business Plan

Once the opportunity appears feasible, the entrepreneur prepares a business plan. It describes the business idea, objectives, target customers, competitors, marketing strategy, operations, management, financial requirements, expected revenues and expenses, and risks.

A business plan is useful not only for investors and banks but also for the entrepreneur. It forces the entrepreneur to think carefully about costs, customers, competition, resources, and implementation.

1.9 Selecting the Legal Structure

The entrepreneur must select an appropriate legal structure according to the nature and size of the business. Possible structures vary by country and may include sole proprietorship, partnership, limited liability structures, or companies. The choice can affect liability, taxation, ownership, compliance requirements, and decision-making.

Professional legal or accounting advice may be appropriate where the business has complex ownership, tax, employment, intellectual property, or regulatory requirements.

1.10 Arranging Finance

A business needs capital to cover startup expenses and working capital. Startup costs may include equipment, technology, premises, registration, product development, inventory, salaries, packaging, transportation, marketing, and professional services.

Possible sources of finance include personal savings, family and friends, bank finance, investors, angel investors, venture capital, grants, government programmes, crowdfunding, and incubator or accelerator support. The appropriate source depends on the business model, risk, capital requirement, and stage of development.

1.11 Legal Registration, Licences and Compliance

Before beginning commercial operations, the entrepreneur must identify the registrations, licences, permits, tax requirements, employment requirements, intellectual property considerations, and sector-specific rules that apply to the business. Requirements vary according to location and industry.

Following legal and regulatory requirements from the beginning reduces the risk of penalties, disputes, interruptions, and loss of customer trust.

1.12 Developing the Product or Service

The entrepreneur now develops the actual product or service. Product development should be based on the problem identified and evidence collected from customers. A service business may develop service procedures, pricing packages, customer support systems, and delivery processes.

For technology or product businesses, a prototype can be created before the final version. A prototype helps the entrepreneur test the concept and identify problems at a relatively early stage.

1.13 Developing a Minimum Viable Product (MVP)

A Minimum Viable Product is a basic version of a product containing enough features to test its central value proposition with early customers. The objective is not to create an incomplete product permanently; it is to learn quickly and avoid spending large amounts of resources before confirming customer demand.

For example, an entrepreneur planning a food-delivery application might first test the service using a simple website, messaging system, or basic application rather than immediately developing a complex platform.

1.14 Testing and Customer Feedback

Before a full launch, the product or service should be tested with a limited number of users. Customers can provide information about usability, quality, design, price, performance, and satisfaction.

- Collect feedback systematically.
- Identify repeated customer complaints.
- Measure whether customers understand the value proposition.

- Correct major quality and usability problems.
- Modify features or pricing where evidence supports a change.

1.15 Branding and Positioning

Branding gives the business a recognizable identity. It may include the business name, logo, colours, packaging, communication style, and overall customer experience. Positioning explains how the business wants customers to perceive its product compared with alternatives.

A strong brand should communicate a clear and credible value proposition rather than simply focusing on attractive design.

1.16 Developing the Marketing and Sales Strategy

The marketing strategy explains how the business will attract customers. Depending on the target market, entrepreneurs may use social media, search marketing, content marketing, advertising, direct sales, partnerships, events, referrals, influencers, email, or traditional media.

The sales process should also be planned. It may include lead generation, customer enquiry, demonstration, purchase, payment, delivery, after-sales service, and customer retention.

1.17 Setting Up Business Operations

Operations include the activities required to produce and deliver the product or service. The entrepreneur may need to arrange suppliers, inventory, equipment, premises, technology, transportation, payment systems, employees, quality control, and customer support.

Efficient operations help maintain product quality, control costs, meet delivery schedules, and provide a consistent customer experience.

1.18 Soft Launch or Pilot Launch

A soft launch introduces the product or service to a limited group of customers before a larger public launch. It provides an opportunity to test the complete business process, including ordering, payment, production, delivery, customer support, and complaint handling.

Problems discovered during a pilot can be corrected before the business spends heavily on marketing or expansion.

1.19 Official Product or Service Launch

After testing and improvement, the entrepreneur launches the product or service to the intended market. The launch may involve promotional campaigns, introductory offers, demonstrations, partnerships, online advertising, events, or public relations.

The entrepreneur should monitor sales, website traffic, customer acquisition, conversion rates, customer complaints, product returns, and other relevant indicators.

1.20 Post-Launch Evaluation and Continuous Improvement

A business must continuously learn after launch. Customer expectations, competition, technology, and market conditions change. The entrepreneur should regularly review performance and make evidence-based improvements.

- Monitor customer satisfaction and retention.
- Track revenue, expenses, and cash flow.
- Measure marketing and sales performance.
- Review product quality and service delivery.
- Study competitor activity and market changes.
- Introduce improvements based on reliable customer feedback.
- Expand only when operations and finances can support growth.

Complete Business Start-up Flow

Business Idea → Problem Identification → Target Customers → Market Research → Competitor Analysis → Business Model → Feasibility Study → Business Plan → Finance → Legal Setup → Product/Service Development → MVP/Prototype → Testing → Branding → Marketing → Operations → Pilot Launch → Full Launch → Customer Feedback → Improvement → Growth

2. What is a Business Plan? Explain the Major Components and Importance

A business plan is a formal written document that explains what a business intends to do and how it intends to achieve its objectives. It describes the business opportunity, products or services, target market, competitive environment, marketing strategy, operations, management, financial requirements, risks, and implementation plans.

A business plan can be prepared before starting a business and updated as the business develops. It is both a planning document and a communication tool.

2.1 Major Components of a Business Plan

1. Executive Summary

The executive summary provides a concise overview of the complete business plan. It normally contains the business concept, problem being solved, product or service, target market, competitive advantage, business objectives, financial requirements, and key expectations. Although it appears first, it is often prepared after the remaining sections have been developed.

2. Business Description

This section explains the nature of the business, its mission and vision, ownership structure, location, industry, objectives, and the problem or opportunity that the business addresses. It should explain why the business exists and what value it intends to create.

3. Product or Service Description

This section describes the product or service in detail. It explains its features, benefits, quality, unique characteristics, development stage, intellectual property where relevant, and how it solves the customer's problem.

4. Market Analysis

Market analysis describes the target customers, market size, market trends, customer behaviour, competitors, barriers to entry, and growth opportunities. It demonstrates that the entrepreneur understands the environment in which the business will operate.

5. Customer Segmentation and Target Market

Customers are divided into meaningful groups based on characteristics such as age, income, location, profession, lifestyle, organization size, or purchasing behaviour. The business identifies the segments it can serve most effectively.

6. Competitive Analysis

The entrepreneur identifies major competitors and compares factors such as price, quality, features, customer service, distribution, brand reputation, and technology. The purpose is to understand the competitive environment and identify opportunities for differentiation.

7. Marketing and Sales Plan

This section describes product positioning, pricing, promotion, distribution, sales channels, customer acquisition, and retention. It should explain how potential customers will discover, evaluate, purchase, and continue using the product or service.

8. Operations Plan

The operations plan describes how the business will produce and deliver its offering. It can include suppliers, production facilities, equipment, technology, inventory, logistics, quality control, working procedures, and customer service.

9. Management and Organization

This section presents the organizational structure, ownership, management team, roles, responsibilities, employee requirements, and relevant expertise. It explains how major business decisions will be made.

10. Financial Plan

The financial plan includes startup costs, sales forecasts, expense estimates, cash-flow projections, projected profit and loss, break-even analysis, funding requirements, and assumptions. It helps determine whether the business can remain financially sustainable.

11. Funding Requirement

If external funding is required, this section explains the amount needed, how funds will be used, the expected funding period, and the proposed financing structure. Potential investors or lenders may use this information to evaluate the opportunity.

12. Risk Analysis

The business plan should identify major risks such as competition, changes in customer demand, supply problems, financial pressure, regulatory changes, technology changes, cybersecurity threats, or operational disruptions. Appropriate mitigation strategies should be considered.

13. Implementation Schedule

The implementation plan identifies major activities, deadlines, milestones, responsibilities, and resources required to move from planning to operation and growth.

2.2 Importance of a Business Plan

- Provides a clear roadmap for starting and managing the business.
- Helps the entrepreneur convert a broad idea into specific objectives and actions.
- Tests whether the business idea is financially and operationally feasible.
- Helps estimate startup costs, revenue, expenses, and funding requirements.
- Identifies risks and allows preventive strategies to be developed.
- Helps entrepreneurs understand customers and competitors.
- Provides a basis for monitoring business performance against planned objectives.
- Helps communicate the business opportunity to investors, banks, partners, and other stakeholders.
- Improves coordination between marketing, operations, finance, and human resources.
- Can be revised as new information becomes available.

2.3 Qualities of a Good Business Plan

- Clear and easy to understand.
- Based on realistic assumptions and evidence.
- Specific about customers, products, costs, and objectives.
- Supported by appropriate market and financial information.
- Flexible enough to be updated when circumstances change.
- Honest about risks, limitations, and uncertainties.

3. Explain the Role of Entrepreneurship in Employment Generation, Economic Growth, and Development of Society

Entrepreneurship is an important component of economic and social development. Entrepreneurs organize resources such as capital, labour, technology, information, and raw materials to create goods and services. Their activities can generate income and employment and can also contribute to innovation and community development.

3.1 Entrepreneurship and Employment Generation

Entrepreneurship creates employment in two major ways: direct employment and indirect employment. Direct employment occurs when a business hires people. Indirect employment

occurs when the business creates demand for suppliers, distributors, transportation providers, maintenance workers, professional services, and other supporting businesses.

- A new enterprise can create jobs for production, sales, administration, technology, marketing, finance, and customer support.
- Business expansion can increase the number and variety of employment opportunities.
- Small enterprises can provide local employment, including in smaller towns and rural communities.
- Self-employment allows individuals to generate income by creating their own businesses or services.
- Entrepreneurial ecosystems create supporting jobs in finance, consulting, logistics, technology, and professional services.

Entrepreneurship can therefore reduce dependence on a limited number of large employers. However, the number and quality of jobs created depend on the size, productivity, financial health, and growth of individual businesses.

3.2 Entrepreneurship and Economic Growth

Economic growth involves an increase in the production of goods and services and the productive capacity of an economy. Entrepreneurial businesses contribute to this process by investing resources, producing goods and services, creating income, and developing new markets.

- Increases production and supply of goods and services.
- Encourages investment and capital formation.
- Generates income for entrepreneurs, employees, suppliers, and service providers.
- Creates new markets and business opportunities.
- Encourages competition among businesses.
- Can improve productivity through new technologies and processes.
- Contributes to public revenues through applicable taxes and fees.

3.3 Entrepreneurship and Innovation

Innovation is closely connected with entrepreneurship. Entrepreneurs may introduce new products, services, technologies, production methods, marketing approaches, or business models. Innovation can improve efficiency, reduce costs, increase convenience, and provide solutions to previously unmet needs.

For example, digital payment businesses have created new ways for customers and businesses to make transactions. Technology-based educational businesses have also developed new methods for delivering learning materials and services.

3.4 Entrepreneurship and Regional Development

Entrepreneurship can support the development of regions that have fewer formal employment opportunities. Local entrepreneurs may use local resources, skills, agricultural products, crafts, tourism opportunities, or community needs to create businesses.

Rural entrepreneurship can create local income opportunities and contribute to value addition. For example, instead of selling raw agricultural products, entrepreneurs can develop processing, packaging, storage, transportation, or marketing businesses.

3.5 Entrepreneurship and Social Development

Entrepreneurship can address social problems when entrepreneurs develop solutions that combine economic activity with social objectives. Social enterprises may work in areas such as education, healthcare, sanitation, environmental protection, accessibility, financial inclusion, and waste management.

Entrepreneurship can also increase access to products and services for groups that are not adequately served by existing markets.

3.6 Entrepreneurship and Improvement in Standard of Living

Businesses provide products and services that satisfy human needs and wants. Increased competition can encourage businesses to improve quality, service, convenience, and efficiency. New products may also provide customers with choices that were previously unavailable.

At the same time, businesses need to operate responsibly because economic activity can also create environmental or social costs. Responsible entrepreneurship considers customers, employees, communities, and the environment.

3.7 Entrepreneurship and Development of Skills

Entrepreneurial activity develops skills such as creativity, leadership, communication, decision-making, negotiation, financial management, problem-solving, teamwork, and risk assessment. These skills are useful not only for business owners but also for employees and students.

3.8 Entrepreneurship and a Culture of Self-Reliance

Entrepreneurship encourages individuals to identify opportunities and take responsibility for creating value. Educational institutions, incubators, skill programmes, mentors, and business networks can support this culture by providing knowledge and practical experience.

3.9 Overall Impact on Society

The contribution of entrepreneurship is broader than simply creating businesses. It connects individual initiative with employment, innovation, economic activity, regional development, consumer choice, and social problem-solving. The overall impact depends on the quality of the entrepreneurial ecosystem, access to finance, infrastructure, education, markets, technology, institutions, and responsible business practices.

4. What is a Startup? Explain the Major Stages of Startup Development and Discuss the Factors Responsible for Startup Success or Failure

A startup is a newly established business that is generally created to develop a product or service and search for a repeatable, sustainable, and potentially scalable business model. Startups often operate under high uncertainty and may use innovation or technology to address a market opportunity.

Not every new business is a startup. A traditional small business may focus on serving a stable local market, while many startups are designed to test a new business model and potentially expand rapidly. The distinction depends on the business's objectives and operating model.

4.1 Major Stages of Startup Development

Stage 1: Problem Identification and Idea Generation

The founders identify a customer problem, unmet need, inefficiency, or new opportunity. The strongest startup ideas usually begin with understanding a genuine problem rather than assuming that customers will automatically want a particular product.

Stage 2: Market Research and Validation

The founders investigate the target customers, existing alternatives, market size, competitors, pricing, and trends. Interviews, surveys, observation, prototypes, landing pages, and other experiments can be used to test assumptions.

Stage 3: Building a Prototype or MVP

The startup creates an early version of its product. A Minimum Viable Product includes the basic functionality necessary to test the core value proposition. The purpose is to learn from real users before committing excessive resources.

Stage 4: Early Customer Acquisition

The startup begins attracting its first customers or users. Founders monitor how customers discover the product, why they purchase it, how frequently they use it, and whether they remain satisfied.

Stage 5: Customer Feedback and Iteration

Customer feedback is used to improve the product, service, pricing, user experience, and business processes. The startup may modify its original idea if evidence shows that a different solution better addresses the customer problem.

Stage 6: Product-Market Fit

Product-market fit refers to a stage where evidence indicates that a meaningful group of customers wants the product and receives sufficient value from it. The startup seeks repeat usage, customer retention, referrals, and sustainable demand.

Stage 7: Establishing the Revenue Model

The startup develops a clear way to generate revenue. Models may include direct sales, subscriptions, commissions, advertising, licensing, usage-based pricing, or combinations of these approaches.

Stage 8: Funding and Resource Expansion

Once the startup demonstrates potential, it may seek additional resources. Funding can come from founders, revenue, loans, grants, angel investors, venture capital, or other sources. Funding should be matched to business requirements and growth plans.

Stage 9: Scaling

The startup expands its customer base, team, technology, production, partnerships, distribution, or geographic coverage. Scaling requires systems and processes that can handle greater demand.

Stage 10: Growth, Maturity, or Exit

A successful startup may develop into a mature company, continue independent growth, merge, be acquired, or pursue another form of exit. Not every startup follows the same path, and some remain small by design.

4.2 Factors Responsible for Startup Success

1. Clear Customer Problem

A startup needs a well-defined problem or need. Understanding the customer helps ensure that resources are directed toward creating meaningful value.

2. Strong Market Demand

A product is more likely to succeed when there is sufficient demand and a reachable customer segment willing to adopt the solution.

3. Effective Product or Service

The offering should provide clear value, acceptable quality, and a useful customer experience.

4. Capable and Complementary Team

Different skills are often required in technology, product development, sales, marketing, finance, operations, and leadership. A team with complementary abilities can respond to these requirements more effectively.

5. Strong Business Model

The startup needs a realistic method of creating value and generating sufficient revenue to support its costs and future development.

6. Financial Discipline

Careful control of cash flow, expenses, pricing, and funding requirements is important because startups often operate with limited resources.

7. Ability to Adapt

Startups need to respond to customer feedback, competition, technology changes, and market developments. Adaptability can be more important than rigidly following an original plan.

8. Effective Marketing and Sales

A useful product still needs customers. Efficient customer acquisition and retention methods help transform product value into sustainable revenue.

9. Innovation

Continuous innovation can help a startup differentiate its product, improve efficiency, and respond to changing customer needs.

10. Strong Networks and Support

Mentors, incubators, accelerators, investors, industry experts, suppliers, and strategic partners can provide knowledge, resources, contacts, and opportunities.

11. Good Customer Service

Customer support, communication, complaint handling, and after-sales service influence customer trust and retention.

12. Sound Legal and Ethical Practices

Compliance, protection of intellectual property, responsible handling of customer data, and ethical business practices help reduce avoidable risks.

4.3 Factors Responsible for Startup Failure

1. Lack of Market Demand

One of the major reasons a startup may fail is that customers do not have a sufficiently strong need for the product or are unwilling to pay for it.

2. Poor Market Research

Incorrect assumptions about customer behaviour, competitors, pricing, or market size can lead to inappropriate decisions.

3. Weak Product-Market Fit

A product may be technically impressive but still fail to provide enough value to a sufficiently large group of customers.

4. Cash-Flow Problems

A startup may run out of money because costs are too high, revenue is insufficient, funding is delayed, or working capital is poorly managed.

5. Unsustainable Business Model

High customer acquisition costs, low margins, weak retention, or unclear revenue sources can make growth financially unsustainable.

6. Poor Execution

Delays, low product quality, unreliable operations, weak customer support, or failure to deliver promised features can damage a startup.

7. Team Conflicts

Founder disagreements, unclear responsibilities, poor communication, and lack of appropriate skills can reduce the effectiveness of the organization.

8. Ineffective Marketing

A startup may have a useful product but fail to communicate its value or reach the customers who need it.

9. Failure to Adapt

Ignoring customer feedback or refusing to change an ineffective strategy can prevent the business from responding to market realities.

10. Premature Scaling

Rapid expansion before establishing product-market fit or sustainable unit economics can increase expenses and operational complexity.

11. Regulatory and Legal Problems

Failure to meet applicable legal, licensing, tax, employment, privacy, or industry requirements can cause serious business disruption.

12. Strong Competition

Established competitors may have greater resources, customer relationships, distribution networks, or brand recognition. Startups need a credible strategy for differentiation.

13. Poor Risk Management

Ignoring technological, operational, financial, cybersecurity, supply-chain, or market risks can create avoidable losses.

4.4 Startup Success Cycle

Identify Problem → Validate Need → Build MVP → Test with Customers → Collect Feedback → Improve Product → Achieve Product-Market Fit → Establish Revenue Model → Raise/Generate Capital → Scale Operations → Grow and Mature

4.5 Comparison of Success and Failure Factors

Factors Supporting Success	Factors Increasing Risk of Failure
Strong understanding of customer needs	Poor understanding of customers
Evidence of market demand	Insufficient market demand
Sustainable business model	Unclear or unsustainable revenue model

Financial discipline	Poor cash-flow management
Skilled and complementary team	Team conflicts or skill gaps
Continuous learning and adaptation	Ignoring feedback and market changes
Efficient customer acquisition	Ineffective marketing and sales
Controlled and timely scaling	Premature or uncontrolled expansion
Quality product/service	Poor execution or quality problems
Compliance and responsible practices	Legal, regulatory, or ethical problems

Conclusion

Entrepreneurship is a process through which individuals and teams identify opportunities, organize resources, develop solutions, and create value. Starting a new business requires much more than having an idea. The entrepreneur must validate the problem, understand customers, research the market, evaluate feasibility, develop a business model, prepare a business plan, arrange finance, meet legal requirements, develop and test the product or service, establish operations, market the offering, and launch it to customers.

A business plan provides a structured roadmap for achieving business objectives. It includes the business description, products or services, market analysis, marketing and sales strategy, operations, management, financial plan, risk analysis, and implementation schedule. It helps entrepreneurs make better decisions and communicate their plans to stakeholders.

Entrepreneurship also contributes to society by creating direct and indirect employment, supporting economic activity, encouraging innovation, improving consumer choice, developing regional economies, and creating solutions to social problems. The impact of entrepreneurship depends on the environment in which businesses operate and on the quality and responsibility of entrepreneurial decisions.

Startups operate under significant uncertainty and normally move through stages such as problem identification, market validation, MVP development, customer testing, product-market fit, revenue development, funding, scaling, and growth or maturity. Startup success is influenced by market demand, customer value, business model, team quality, financial discipline, execution, adaptability, and effective marketing. Failure can result from weak demand, poor financial management, poor execution, team problems, ineffective marketing, premature scaling, or failure to adapt.

Therefore, entrepreneurship skills are valuable not only for starting a business but also for developing creativity, problem-solving, leadership, decision-making, communication, financial awareness, and the ability to respond to changing opportunities.
